Audit Report

ID	Area	Issue	Priority
H1	HTML and content	No address anywhere on the site	High
R1	CSS and responsive	Fixed widths force sideways scrolling	High
R2	CSS and responsive	Media query can never match	High
R3	CSS and responsive	Homepage has no viewport tag	High
A1	Accessibility	Focus ring removed from every link	High
A2	Accessibility	Map image has no alt text	High
D1	Discoverability	Share title makes a false ranking claim	High
P1	Release quality	Signup for doesn’t send anything	High
H2	HTML and content	Vendor table has no header cells	Medium
R4	CSS and responsive	Header nav runs off narrow screens	Medium
A3	Accessibility	Eyebrow text fails contrast	Medium
D2	Discoverability	Homepage has no meta description	Medium
P2	Release quality	Editor’s note published as visitor copy	Medium
H3	HTML and content	Homepage heading structure is wrong	Low
P3	Performance	Unsized images shift the page	Low

HTML and Content structure

H1 – The site never says where the market is.

1. Condition: All 4 pages, mainly visit.html “Getting here”
2. Finding: No address, city, or venue appears anywhere. Directions point to an “east entrance” of an unnamed place, and the on ly map is an unlabeled placeholder.
3. Evidence: A search of all four pages found no location text. The map file is map-placeholder.svg, and the CSS crops it.
4. Impact: Every visitor attempting to “Plan you visit” can’t complete and local search can’t tie the site to a place.
5. Priority: High
6. Next step: Redesign the content: get the confirmed address, add it as text on visit.html and in the footer, and replace or remove the placeholder map.

H2 – Vendor table has no header calls

1. Condition: vendors.html and Lighthouse 13.4.1
2. Finding: The header row is coded with <td>. There’s no <th>, scope, or caption.
3. Evidence: Lighthouse failed the check “<td> elements in a large <table? Do not have table headers.” The page still scored 100 for Accessibility because Lighthouse gives this check no weight.
4. Impact: Screen reader users would hear “Yes” or “8:00 AM” without knowing which column it belongs to.
5. Priority: Medium
6. Next step: Change the top row to <th scope=”col”> cells and add a <caption>

H3 – Homepage headings are out of order

1. Condition: index.html and W3C NuHTML checker with the outline view on
2. Finding: “Market goals” is an <h3>, so it looks like part of the “Design pop-ups” card instead of its own section. The card row above it also has no heading.
3. Evidence: NuHTML Checker: warned “Section lacks heading at line 30, and its outline shows “Market goals” nested under “Design pop-ups”.
4. Impact: Screen reader users who jump between headings would get a confusing page outline.
5. Priority: Low

6. Next step: Make “Market goals” an <h2>, and give the card row a heading or change it to a div.

CSS and Responsive behavior

R1 – Pages scroll sideways on phones and when zoomed

1. Condition: All 4 pages and Chrome DevTools at 320px wide and at 200% zoom
2. Finding: The page is loced at 1120px wide, and the gird columns are fixed sizes, so the layout can’t shrink.
3. Evidence: Chrome DevTools: every page 800px wider than the screen at 320px, and 480px wider at 200% zoom.
4. Impact: Phone users and anyone who zooms in must scroll sideways to read ever line.
5. Priority: High
6. Next step: Use width: 100%; max-width: 1120px and flexible grid columns, the re-test 320px and 200%

R2 – The mobile layout rule can never turn on

1. Condition: styles.css, all 4 pages, Chrome DevTools at 320, 640, 1280px
2. Finding: @media (min-width: 980px) and (max-width: 760px) asks for a screen that’s wider than 980px and narrower than 760px at the same time. That’s impossible, so the one-column phone layout never runs.
3. Evidence: Chrome DevTools: matchMedia(): returned false at every screen width tested. The CSS validator still passed it because the syntax is valid.
4. Impact: The site has no working mobile layout.
5. Priority: High
6. Next step: Rewrite it as @media (max-width: 760px) and fix it together with R1

R3 – Homepage is missing its viewport tag

1. Condition: index.html and Chrome phone emulation (iPhone SE, 320px)
2. Finding: The homepage has no <meta name=”viewport”> tag. The other three pages have one.
3. Evidence: Chrome phone emulation: the homepage drew itself as a desktop page and the text was super tiny.

4. Impact: Every phone visitor's first page is hard to read and tap, and mobile CSS won't weork on it even after R1 and R2 are fixed.
5. Priority: High
6. Next step: Add <meta name="viewport" content="width=device-width, initial-scale=1"> to index.html.

R4 – Navigation runs off narrow screens

1. Condition: All 4 pages and Chrome at 320px wide
2. Finding: The nav links are set to wrap (white-space: nowrap) so they stay on one line even when they don't fit.
3. Evidence: Chrome at 320px: The nav ran 77px past the right edge of the screen and cut off "Vendor signup."
4. Impact: Phone users can't easily reach the vendor sign up link.
5. Priority: Medium
6. Next step: remove nowrap and add flex-wrap: wrap to the header and Nav.

Accessibility

A1 – Links show no focus ring for keyboard users

1. Condition: All 4 pages pressing tab in Chrome
2. Finding: The rule a:focus {outline: 0; } hides the outline that normally shows which link is selected
3. Evidence: Keyboard Tab test: none of the links across the 4 pages showed a focus ring. The signup form fields still did, which proves this rule is the cause.
4. Impact: People who use a keyboard instead of a mouse can't see where they are on the page.
5. Priority: High
6. Next step: Delete the rule, or replace it with a clearly visible :focus-visible outline.

A2 – Missing map image has no alt text

1. Condition: visit.html and W3C Nu HTML Chekcer
2. Finding: The map image <img scr="assets/map-placeholder.svg"> has no alt attribute

3. Evidence: Nu HTML Checker: reported the error “an img element must have an alt attribute.
4. Impact: Screen readers will just read out the file name or just image so vision impaired users get nothing useful.
5. Priority: High
6. Next step: Add alt=”” hile the map is a placeholder, then real alt text once there’s a real map.

A3 – Small orange text is too faint

1. Condition: index.html, “Saturday Community Market” label and Chrome DevTools contrast check
2. Finding: The orange label (#c65f3d) on the cream background (#fffdf7) doesn’t have enough contrast.
3. Evidence: Chrome DevToos: on the homepage the color picker for .eyebrow shows a contrast ratio of 4.04 and fails both AA (4.5) and AAA (7.0). Text this size needs to at least 4.5:1.
4. Impact: Hard to read for people with low vision, or for anyone looking at a phone outside.
5. Priority: Medium
6. Next step: Use a darker orange such as #8b4227 which gives a contrast ration of 7.09.

Discoverability and metadata

D1 – Share title makes a false ranking claim

1. Condition: visit.html line 8
2. Finding: The og:title reads “Best farmers market in Arizona with guaranteed top rankings.” It doesn’t match the page, and it’s the only share tag on the site.
3. Evidence: Google Search Central: states that “no one can guarantee a #1 ranking on Google,” so the claim is false.
4. Impact: Anyone who shares the page shows someone a spammy headline, which hurts the market’s credibility.
5. Priority: High
6. Next step: Change it to “Visit Desert Bloom Market” Add the other share tags such as image and description.

D2 – Homepage has no search description

1. Condition: Index.html <head>
2. Finding: The homepage has no <meta name= “description”>. The other three pages have one.
3. Evidence: Page source review: the homepage <head> has only a chartset, a title, and a stylesheet.
4. Impact: Google and share previews have to guess a summary for the site’s most important page.
5. Priority: Medium
6. Next step: Add a one-sentence description of what the market is, when it runs, and where.

Performance, compatibility and release quality

P1 – Signup form doesn’t send anything

1. Condition: signup.html, filled out the form in Chrome and clicked “Submit interest”
2. Finding: The <form> has no action no method, so submitting just reloads the page and throws the answers away.
3. Evidence: Form Submit test: the page reloaded with every answer in the address bar, including the email. The fields went blank, and no confirmation appeared. https://vincentrosa1.github.io/GIT-414-Module-0-Deliverable-/signup.html?business=Vincent+test&email=test%40vincentrosa.com&type=Prepared+food&needs=Test
4. Impact: Vendors think they’ve signed up but nothing is received, and their email address end up in browser history.
5. Priority: High
6. Next step: Connect a form service with method=”post” and a thank-you message. Until then, replace the form with an email link or something similar.

P2 – An editor’s note was published by mistake

1. Condition: vendors.html line 23
2. Finding: The intro says “Confirm details before publishing official listings,” a reminder meant for the site’s editors, not visitors.
3. Evidence: Manual page review: It appears as the first paragraph under the page heading. No tool would catch something like this.

4. Impact: Visitors read it as a warning that the vendor list can't be trusted.
5. Priority: Medium
6. Next step: Replace it with visitor-friendly text and move the reminder into a release checklist.

P3 – Visit page jumps while the map loads

1. Condition: visit.html and Lighthouse 13.4.1 (mobile)
2. Finding: The image has no width and height, so the browser doesn't save space for them while they load.
3. Evidence: Lighthouse: flagged "image elements do not have explicit width and height" for the map image.
4. Impact: On a slow connection, text can jump down when the map appears, so readers may lose their place or tap the wrong thing.
5. Priority: Low
6. Next step: add width and height to both images, then retest Lighthouse.
